Object Oriented Programming
Assignment-05
Practice of RayLib

Objective:

Design and develop a game using the skills and concepts we practiced in class. Let your creativity shine and add your personal touch to make the game unique and enjoyable.

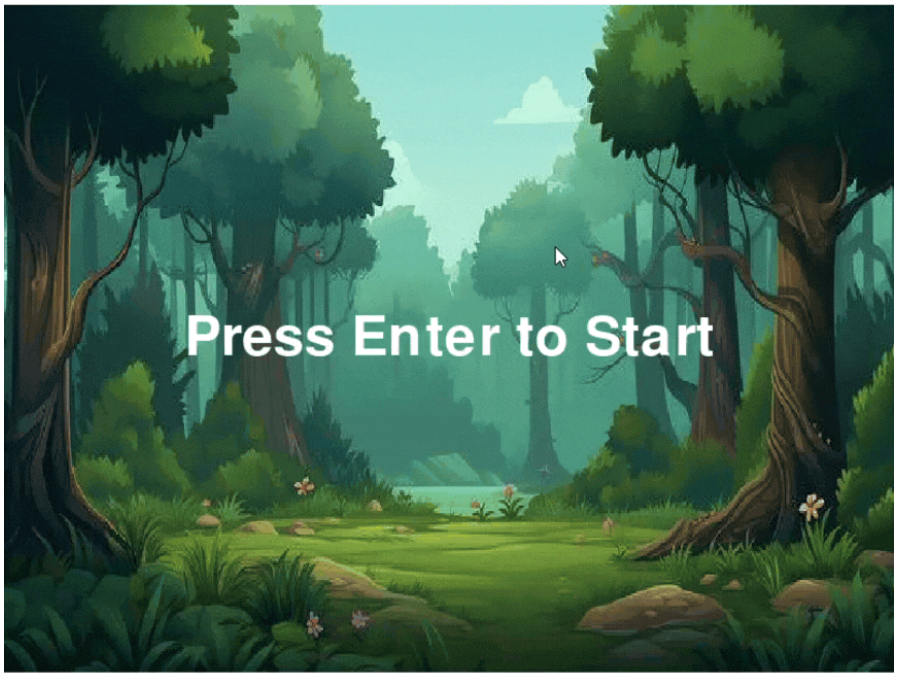
Following Features are just to give you an idea try to make your own features:

Basic Game Features:

1. **Random Ball Spawning:**
    - The game should include balls that spawn randomly across the game area.
    - Each ball type (e.g., green, red, or any other colors) can have unique effects or interactions.
2. Background move:
    - The background should move horizontally or vertically.
3. **Player Movement:**
    - Implement smooth player controls to navigate through the game.
    - The player should be able to catch or avoid balls using these controls.
4. **Score System:**
    - Increase the score when the player successfully catches a green ball.
    - Feel free to experiment with adding penalties (e.g., subtract points) for catching specific other-colored balls to make the game more challenging
5. Health feature:
    - The player should not die immediately rather its health should decrease

Game Mechanics:

1. **Start Screen:**
    - Create an engaging start screen with the game's title and options like "Start Game," "Instructions," and "Quit."
    - Include a brief explanation of the game rules or controls in the "Instructions" section.
2. **Game Over State:**
    - When the game ends, display a "Game Over" screen.
    - Provide options to restart the game or exit to the main menu/quit.



Good luck
