Quiz 16 **Roll number:** BSSE - ~~2408~~ 24028

Write a C++ program that first declares a 2D array of size 3x3 and fills that array using user input. Define two pointers one pointing to the first row and the other pointing to the last row. Swap first and last row using these pointers.

Note: Do not use offsets with the pointers, instead, move each pointer one element forward after each swap. This means you should avoid expressions like *(ptr + offset).

10

```
#include <iostream>
using namespace std;
int main() {
    int arr[3][3];
    cout << "enter elements of array";
    for (int i=0; i<3; i++) {
        for (int j=0; j<3; j++) {
            cin >> arr[i][j];
        }
    }
    int *ptr1 = &arr[0][0];      // first row
    int *ptr2 = &arr[3][3];      // last row
    int temp = *ptr1;
    *ptr1 = *ptr2;               // swap rows
    *ptr2 = temp;
    cout << arr[3][3] << endl;
```

This will print last element; use for loop to iterate and print

```
    return 0;
}
```

you have to iterate, but this approach will work to so. :)
